## Common borders. Common solutions.

The Laboratory of Ecological Engineering and Technology serves the educational, research and development needs of the Region in the fields of:

- A. Management and restoration of rivers, lakes, reservoirs, groundwater and coastal aquatic systems,
- B. Environmental hydraulics, hydrodynamics, hydrology and water resources management,
- C. Integrated wastewater management using Natural Treatment Systems and Constructed Wetlands.

Project funded by  
EUROPEAN UNION

## D.T1.2.1

### Report on dynamics of coastal line changes (3)

1. Nestos River Delta and adjacent coastal zone (GR)
2. Kolkheti lowland and nearby coastal area (GE)
3. Dniester River Delta and adjacent coastal area (UK)

# Methodology of Coastal Erosion Assessment

The methodology comprised the **supervised semi-automatic classification** processing technique by applying **classification algorithms** and **spatial analysis processes**.

# Historical satellite imagery

LANDSAT 4-5 & 8  
(15-30 m)

1972 - Today

RapidEye  
(5 m)

2009 - 2020

Sentinel 2  
(10 m)

2015 - Today

**PlanetScope**  
**(3.1m)**

2016 - Today

# Historical satellite imagery

**The image selection is based on:**

- **Clarity** from cloud cover
- The correct **geo-reference** and **orthorectification**
- **Sea surface height (CMEMS data)**
- The **seasonality** (all images retrieved in the summer months)

# Shoreline extraction methodology

*Semi-Automatic Classification Plugin (SCP) for QGIS*

**Near Infrared Band**

**Classified Image**

**Raster to Vector**

**Shoreline Extraction**

**Smoothed Shoreline**

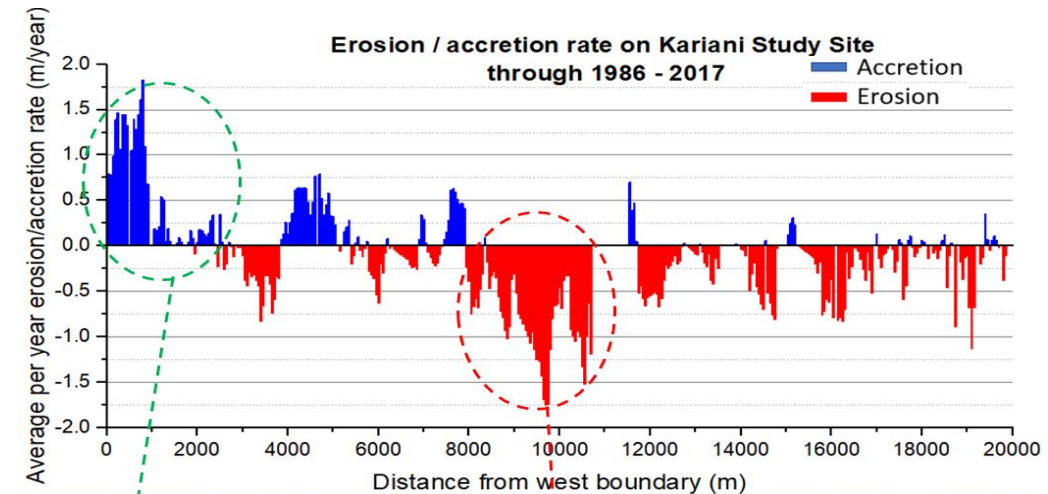

**Historical Shorelines**

# Evaluation of Shoreline Evolution

## *Digital Shoreline Analysis System (DSAS) by U.S. Geological Survey (USGS) in ArcMap (ESRI)*

- The DSAS procedure was set using **transects** every 20 m
- The **reference baseline** was manually digitized and positioned offshore and parallel to the most recent coastline (coastline of 2017)
- The DSAS tool provides to the user **parameters** such as:
  - ✓ Net Shoreline Movement (NSM)
  - ✓ End Point Rate (EPR)
  - ✓ Weighted Linear Regression Rate (WLR)
- Using the data produced from **DSAS transects**, was applied **statistical analysis** of the shoreline change through years by using *Python* algorithms

## D.T1.2.4

# Report on Integrated assessment on wetland and floating vegetation (4)

1. Nestos River Delta and adjacent coastal zone (GR)
2. Kolkhети lowland and nearby coastal area (GE)
3. Dniester River Delta and adjacent coastal area (UK)
4. Lake Sevan (AM)

Project funded by  
EUROPEAN UNION

## Northern part of Dniester estuary with river mouths (110 sq.km.)

30°0'E

30°5'E

30°10'E

30°15'E

Project funded by  
EUROPEAN UNION

## Methodology

### What we measured?

❖ Emergent (wetland) vegetation cover

❖ Sum of floating vegetation (rooted and non-rooted) and submerged vegetation cover

## D.T1.2.6

# Report on Agricultural water balance, water productivity and water stress indices (3)

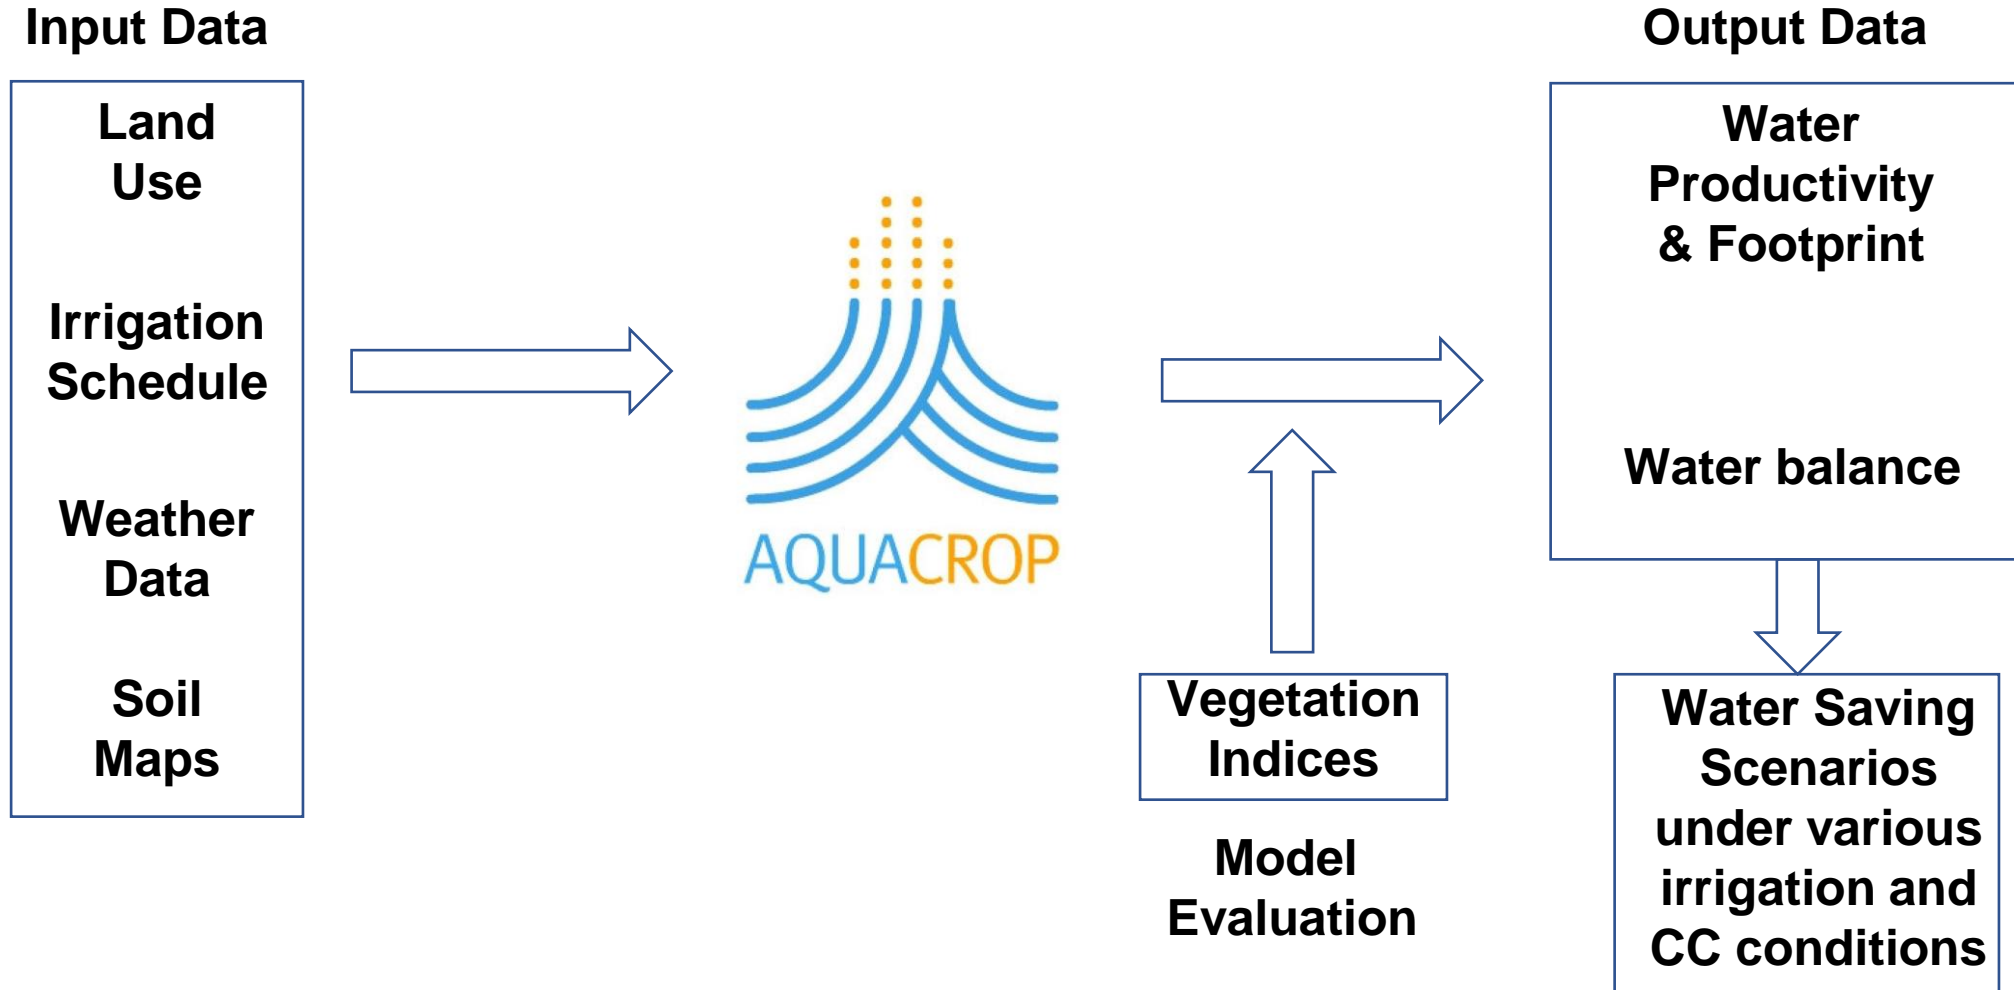

1. Nestos River Delta and adjacent coastal zone (GR)
2. Kolkhети lowland and nearby coastal area (GE)
3. Dniester River Delta and adjacent coastal area (UK)
4. Lake Sevan (AM)

# Methodology of Soil Water Balance Estimation

The Soil Water Balance method is going to be based on the combined use of

- a crop growth model (AquaCrop, FAO) fed up with
  - available satellite derived and/or computed evapotranspiration data (SEN-ET project; NOAA data)
  - historic weather data from Copernicus (ECMWF, NOAA) or local-national datasets
  - local, national or European level soil maps
  - satellite, local or national level land use maps (CORINE)
  - local or national irrigation regulations and practices
- satellite obtained vegetation indices (e.g., NDVI) capable to assess plants' water stress status.

# Methodology of Soil Water Balance Estimation

# Satellite Imagery Acquisitioned Data

**Sentinel 2**

**Vegetation  
Indices (10 m)  
(NDVI, SAVI)**

**Land  
Use (10 m)**

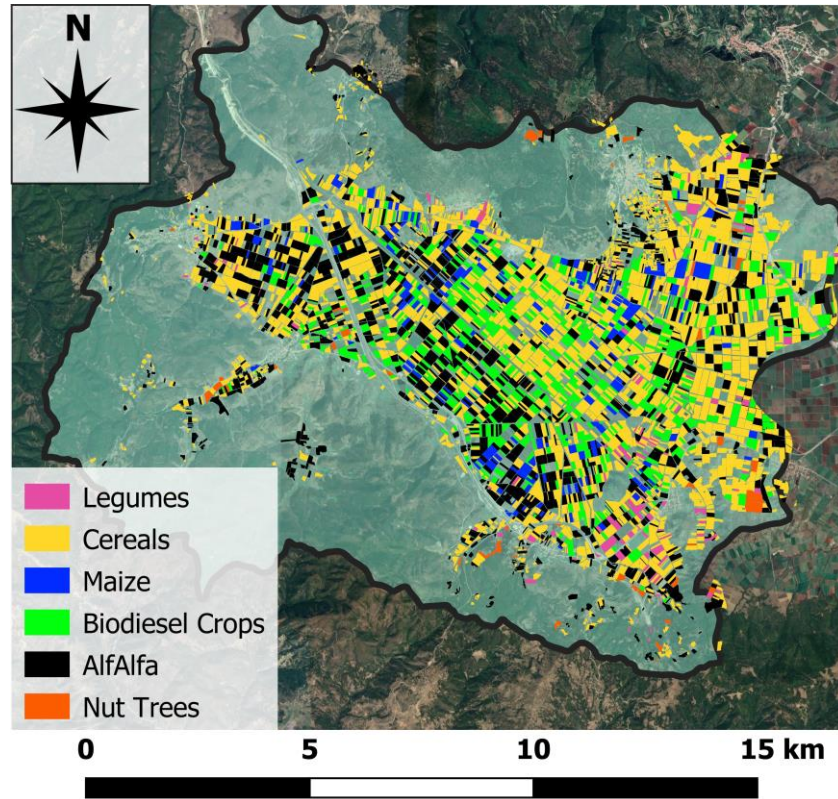

**Sentinel 3**

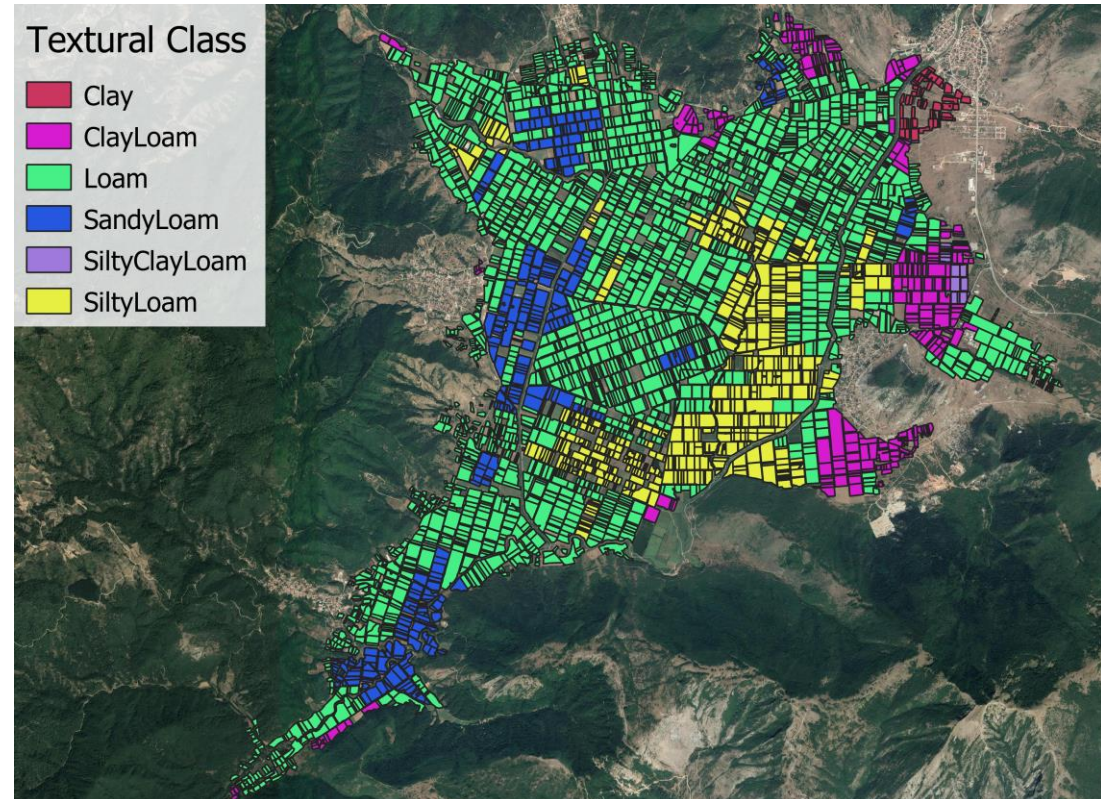

**Evapotranspiration  
(20 m)**

# Local – National Data

## Land Use Maps

## Soil Maps

# AquaCrop Model

- Simulating the individual crops canopy cover (CC) development throughout the cultivation season based on the implemented irrigation schedules and weather conditions.
- Estimating the root zone water depletion ( $D_r$ ) in a day time step.
- Assessing potential deep percolation and water runoff after intensive rainfall events or excessive water application through irrational irrigation.
- Estimating the crop yield and the corresponding crop water productivity.
- Suggesting optimized irrigation schedules for maximum water productivities.
